Vermicompost

➤ Introduction: Vermicompost

Vermicasting, also called vermicomposting, is the processing of organic wastes through earthworms (Figure 1). It is a natural, odourless, aerobic process, much different from traditional composting. Earthworms ingest waste, then excrete casts — dark, odourless, nutrient- and organically rich, soil mud granules that make an excellent soil conditioner. Earthworm casts are a ready-to-use fertilizer that can be used at a higher rate of application than compost, since nutrients are released at rates that growing plants prefer.

Vermicasting can be done on a small scale by homeowners with household organic wastes, on a large-scale by farmers with manure or by the food industry using organic wastes such as fruit and vegetable cull materials. Through proper design, vermicasting is a method of waste handling that:

- is clean, socially acceptable, with little to no odour
- requires no energy input for aeration
- reduces the mass of waste by 30%
- produces a valuable vermicast byproduct
- even generates worms as fishing bait

Important facts about vermicasting:

- Turning organic wastes into casts takes 22–32 days, depending on density of waste and earthworm maturity (regular composting requires 30–40 days, followed by 3–4 months curing).
- Vermicast does not need curing, but fresh casts undergo 2 weeks of nitrification where ammonium transforms to nitrate, a form that plants can uptake.
- Use organic materials that meet the earthworm's feed preferences, including a material density of 350–650 g/L.
- Worms should not be crowded, so the ideal stocking density is 150 earthworms/L of wastes.
- Earthworms ingest about 75% of their body weight/day; a 0.2 g worm eats about 0.15 g/day.
- If you discover earthworms trying to escape any system, it is a good indication that something is wrong with their feed or environment
- Earthworms should be allowed about 1 week to migrate from finished vermicast to fresh waste.

➤ Vermicomposting Definition

"Vermicomposting is a process in which the earthworms convert the organic waste into manure rich in high nutritional content."

Read on to explore what is vermicomposting and the process involved in vermicomposting.

➤ What is Vermicomposting?

Vermicomposting is the scientific method of making compost, by using earthworms. They are commonly found living in soil, feeding on biomass and excreting it in a digested form.

Vermiculture means "worm-farming". Earthworms feed on the organic waste materials and give out excreta in the form of "vermicasts" that are rich in nitrates and minerals such as phosphorus, magnesium, calcium and potassium. These are used as Fertilizer and enhance soil quality.

Vermicomposting comprises two methods:

- **Bed Method:** This is an easy method in which beds of organic matter are prepared.
- **Pit Method:** In this method, the organic matter is collected in cemented pits. However, this method is not prominent as it involves problems of poor aeration and waterlogging.

Also, refer to Morphology and Anatomy of Earthworm

➤ Process of Vermicomposting

The entire process of vermicomposting is mentioned below:

➤ Aim

To prepare vermicompost using earthworms and other biodegradable wastes.

➤ Principle

This process is mainly required to add nutrients to the soil. Compost is a natural fertilizer that allows an easy flow of water to the growing plants. The earthworms are mainly used in this process as they eat the organic matter and produce castings through their digestive systems.

The nutrients profile of vermicomposts are:

- 1.6 per cent of Nitrogen.

- 0.7 per cent of Phosphorus.
- 0.8 per cent of Potassium.
- 0.5 per cent of Calcium.
- 0.2 per cent of Magnesium.
- 175 ppm of Iron.
- 96.5 ppm of Manganese.
- 24.5 ppm of Zinc.

➤ **Materials Required**

- Water.
- Cow dung.
- Thatch Roof.
- Soil or Sand.
- Gunny bags.
- Earthworms.
- Weed biomass
- A large bin (plastic or cemented tank).
- Dry straw and leaves collected from paddy fields.
- Biodegradable wastes collected from fields and kitchen.

➤ **Procedure**

1. To prepare compost, either a plastic or a concrete tank can be used. The size of the tank depends upon the availability of raw materials.
2. Collect the biomass and place it under the sun for about 8-12 days. Now chop it to the required size using the cutter.
3. Prepare a cow dung slurry and sprinkle it on the heap for quick decomposition.
4. Add a layer (2 – 3 inch) of soil or sand at the bottom of the tank.
5. Now prepare fine bedding by adding partially decomposed cow dung, dried leaves and other biodegradable wastes collected from fields and kitchen. Distribute them evenly on the sand layer.
6. Continue adding both the chopped bio-waste and partially decomposed cow dung layer-wise into the tank up to a depth of 0.5-1.0 ft.
7. After adding all the bio-wastes, release the earthworm species over the mixture and cover the compost mixture with dry straw or gunny bags.
8. Sprinkle water on a regular basis to maintain the moisture content of the compost.
9. Cover the tank with a thatch roof to prevent the entry of ants, lizards, mouse, snakes, etc. and protect the compost from rainwater and direct sunshine.

10. Have a frequent check to avoid the compost from overheating. Maintain proper moisture and temperature.

Result

After the 24th day, around 4000 to 5000 new worms are introduced and the entire raw material is turned into the vermicompost.

➤ Advantages Of Vermicomposting

The major benefits of vermicomposting are:

1. Develops roots of the plants.
2. Improves the physical structure of the soil.
3. Vermicomposting increases the fertility and water-resistance of the soil.
4. Helps in germination, plant growth, and crop yield.
5. Nurtures soil with plant growth hormones such as auxins, gibberellic acid, etc.

Also refer: Vermiculture

➤ Disadvantages of Vermicomposting

Following are the important disadvantages of vermicomposting:

1. It is a time-consuming process and takes as long as six months to convert the organic matter into usable forms.
2. It releases a very foul odour.
3. Vermicomposting is high maintenance. The feed has to be added periodically and care should be taken that the worms are not flooded with too much to eat.
4. The bin should not be too dry or too wet. The moisture levels need to be monitored periodically.
5. They nurture the growth of pests and pathogens such as fruit flies, centipede and flies.

Vermicomposting turns the kitchen waste and other green waste into dark, nutrient-rich soil. Due to the presence of microorganisms, it maintains healthy soil.

Vermicomposting is an eco-friendly process that recycles organic waste into compost and produces valuable nutrients.

Our institute conduct course 'Online Learning Course' After the completion of this course students have got following outcomes:

1. Overall I really like this class because all lectures, assignments, and tests are straight forward.
2. A couple things I dislike about the class are that there should be more opportunities for extra credit and it would be awesome if the final was an objective essay about what we have learned in this class or what we like about the class.
3. I believe that I have more knowledge about ocean, weather, and marine lives and hopefully, I can use them in real life.
4. A great deal of research is available about online learning outcomes in such areas as achievement, persistence, retention, and satisfaction.
5. Knowledge augmentation, tailored learning experiences, improved engagement, access to online study material, ease of communication, and, most significantly, remote access are all advantages of a learning app.
6. enable the instructor to identify and meet individual student needs as well as encourage students to participate and continue to participate at a high quality level.
7. There's no need to rearrange schedules, students in an online program can take the course they want and complete the coursework at a time that is most convenient for them.
8. Through online courses, students can gain the knowledge they need to earn their degree or grow in their profession.
